What is Oesophageal Manometry?

Oesophageal manometry is a procedure to measure the strength and function of your oesophagus (gullet) and provides information about how the muscles in your throat and oesophagus work as food and liquids pass from the mouth to the stomach.

The test involves passing a plastic tube through the nose, down into the stomach and oesophagus and is performed for the following reasons:

- To evaluate the cause of reflux (regurgitation) of stomach acid back up into the oesophagus (gastro-oesophageal reflux or GORD).
- To determine the cause of swallowing difficulties.
- To determine the cause of chest pain thought not to be related to the heart.

Preparation for the procedure

This investigation must be done on an empty stomach.

- If you have a morning appointment you must not eat anything after midnight the night before but can have sips of water up to 7am on the morning of the investigation. If you have an afternoon appointment you must not eat anything after 7am but can have sips of water up to 11.30am. If you are taking diabetic medication you can contact your GP or nurse specialist for advice.
- On arrival at the endoscopy unit you will be booked in by a nurse, who will take details of your medical history and any medications you take. **Please bring a list of your medications with you.**

What will happen during the test?

- You may opt for a local anaesthetic spray into one your nostrils, which will taste unpleasant but will not be painful.
- A flexible plastic tube is passed through the nose, over the back of the throat and into the stomach. You will be asked to drink a small amount of water through a straw to help the tube go down. This part of the procedure is sometimes a little uncomfortable and can make patients cough or gag but will only last a minute or so.
- Once the tube is in position the doctor or nurse will use a syringe to squirt a small amount of water into your mouth which you will then be asked to swallow. This will be repeated about ten times.
- The tube is then removed, which does not hurt and of the examination is complete.

This should all take no longer than 20 minutes.

What happens after the test?

- Because your throat has been numbed, you need to wait 20 minutes before eating or drinking.
- You are able to drive straight away as you will not have received any conscious sedation.

When will I get the results of the procedure?

The results will not be available straight away. The results will be analysed and a report sent to the doctor who referred you.

Are there any risks?

Oesophageal Manometry is a very safe procedure, side effects are minor. Some people experience a sore throat for a day or so. Other rare side-effects include nosebleeds or sinus problems, which are usually mild and short-lived.

Occasionally people are unable to tolerate the tube being passed over the back of the throat and it is not possible to do the test.

Although oesophageal manometry is a very sensitive test, no procedure is 100% accurate and there is a small chance that abnormalities can be missed.

If you are worried about any of these risks, please call us before you have this procedure.

Are there any alternatives to Oesophageal Manometry?

Your doctor has recommended oesophageal manometry as it is the best way of diagnosing your swallowing problems.

What happens if I decide not to have Oesophageal Manometry?

Your doctor may not be able to confirm the cause of the problem. If you decide not to have oesophageal manometry you should discuss this carefully with your doctor.

If after the investigation you experience severe tummy pain, swelling in the neck or chest pain please telephone:

- Accident and Emergency at Watford on 01923 217256 or your nearest Accident and Emergency.
- Please note: there is **NO** Accident and Emergency at Hemel Hempstead or St Albans City Hospitals.
